ECONOMIC SECURITY PROGRAM AND OTHER INCOME

A daily allowance is payable for each day spent practicing harvesting activities in the bush EXCEPT for days when other income is received.

FOR THE BENEFICIARIES OF THE ECONOMIC SECURITY PROGRAM FOR CREE HUNTERS

EXAMPLES OF OTHER INCOME

WORK
EMPLOYMENT INSURANCE
TRAINING ALLOWANCE
INCOME REPLACEMENT COMPENSATION
ETC.

2020-2021 COVID-19 FINANCIAL ASSISTANCE

If you receive CERB
(Canada Emergency Response Benefit)
or another Emergency covid-related benefit
(« Income replacement compensation »),
days spent in the bush
while receiving this income
are not payable.

However, they can be accounted towards the minimum of 120 days in the bush required to be eligible for the program the following year.

Sucker

ANIMAL PROFILE

English Name: Sucker

French Name: Meunier

Scientific (Latin) Name: *Catostomus*

Cree Name: Namepij

Cree Syllabics: ᓇᓴᓐ

SUCKER IS A GENERIC NAME FOR SEVERAL SPECIES OF FISH THAT FEED OFF THE BOTTOM OF LAKES OR RIVERS.

In Eeyou Istchee, there are two common species of suckers: the longnose sucker (*Catostomus commersoni*) and the white sucker (*Catostomus commersoni*). Both of these fish have a body that's basically round, with soft skin and usually range between 30 and 45 cm (12 to 18 inches). Suckers are most easily recognized by the position of their mouth, which is at the tip of their head, but opens like a tube pointing down. Their mouth has no teeth and very big lips, which helps them pick up food off the bottom of lakes and rivers.

“Their mouth has no teeth and very big lips, which helps them pick up food off the bottom of lakes and rivers.”

The longnose sucker, also called red sucker, gets its name from its long and pointy head, much longer than that of the white sucker.

During spawning, males of the longnose suckers will develop a large orange stripe on the sides, which gives them their name in French “meunier rouge” meaning red sucker. In contrast, the white sucker is much paler in coloration and has a shorter and rounder head. Both species may occur in the same lakes but typically red suckers spawn before white suckers and also occupy colder and deeper lakes compared to the white sucker.

“The Cree will often use suckers for bait for trapping but they can be eaten as well, especially in spring.”

Spawning occurs in April or May, in very shallow water. Both suckers feed on invertebrates, such as insect larva, small mollusks and worms. All suckers are important food for larger predatory fish such as northern pike or lake trout. Both suckers are seldom caught on rod and reel but are often captured in nets. In the spring, when they spawn, it is easy to observe suckers swimming in shallow water at the base of rapids or at the mouth of small and shallow creeks with gravel bottoms. The Cree will often use suckers for bait for trapping but they can be eaten as well, especially in spring. They are most often abundant in every lake and river of Eeyou Istchee though seldom detected, unless somebody puts a net where they occur.

NEWS & REPORTS

RETIREMENT OF RÉGENT BRIND'AMOUR

In January of 2021, Mr. Régent Brind'Amour, the Director of Administrative Services (AKA Mr. Nice Guy) retired after 33 years of distinguished service with the Board. Mr. Brind'Amour started serving the Program in 1987 as an accountant and his retirement is well deserved! We wish him the best for his retirement plans and we hope that he will enjoy the benefits after a long and successful career.

WELCOME MICHAEL WILSON

On March 11 2021, the Board welcomed a new person as part of its team, Mr. Michael Wilson, Chartered Professional Accountant. Mr. Wilson was hired as replacement for Mr. Régent Brind'Amour, who had retired in January. Mr. Michael Wilson is fully bilingual and comes with extensive and international experience in private corporations, as well as many years of experience in auditing. We are sure that Mr. Wilson will enjoy his job working with the Cree, especially since he is a hunter and fisherman himself! Welcome to the team Mr. Michael Wilson!

HARFANG DES NEIGES AWARD

In 2020, Director General Serge Larivière received the prestigious award “Harfang des Neiges” for his contributions to wildlife sciences. This award, announced in May 2021 because of the COVID-19 pandemic, was given by the Government of Québec and the Ministère des Forêts, de la Faune et des Parcs. On the official website (<https://mffp.gouv.qc.ca/la-faune/prix-harfang-neiges/>) Minister Pierre Dufour recognized Dr. Larivière for his research efforts notably in the management and advancement of sciences regarding wild fur-bearing animals of Québec. Dr. Larivière is well known as a public speaker on wildlife issues, and writes numerous popular science articles about hunting and trapping for outdoor magazines. If you know Serge, you know he has a true passion for wildlife and furbearers! Congratulations Dr. Larivière for this great honour!

M. Serge Larivière

PRIX HARFANG DES NEIGES

Passionné de la nature depuis toujours, M. Serge Larivière détient un doctorat en écologie animale de l'Université de la Saskatchewan. Il a également effectué un stage postdoctoral à l'Université Laval. Son intérêt soutenu pour la gestion et la conservation de la faune ainsi que pour l'acquisition et la vulgarisation de connaissances sur les animaux à fourrures du Québec l'a mené à travailler, entre autres, sur la gestion du lynx roux, les mythes relatifs à la présence de cougars au Québec ainsi que les problèmes et les effets sur la faune de la présence des loups et des coyotes. M. Larivière est aussi un communicateur accompli: rédacteur en chef de la revue «Le Coureur des Bois» depuis 15 ans et fondateur de la revue «The Cree Hunter and Trapper», il est aussi chroniqueur pour la revue «Aventure Chasse et Pêche». M. Larivière a publié plus d'une centaine d'articles scientifiques et plus de 500 articles de vulgarisation scientifique. Ses travaux sont repris dans les émissions de plusieurs chaînes renommées, dont Canal D, Historia et Radio-Canada.

COVID-19 UPDATE

Since the COVID-19 pandemic started in March 2020, activities of the Board have been forced to halt in many ways. Luckily, the Economic Security Program for Cree Hunters was kept in place due to the dedication and hard work of its staff, as much in Cree communities as at the Head Office.

Luckily, to this day, none of the staff of the Cree Hunters Economic Security Board have been personally infected by COVID-19 and we hope that this situation remains the same until we can all access the vaccine. In the meantime, unnecessary travel to Cree communities has been halted and some meetings that were considered important had to be postponed. The Board still meets regularly to oversee the operations of its staff and the program continues to be delivered.

The Board wishes to thank its staff in all Cree communities, as well as the staff of the Head Office for being able to deliver this important program, even with the difficulties imposed by the COVID-19 pandemic.

We all hope that this situation will be resolved and that we will be able to return to normal operations soon, but in the meantime, rest assured that we will do our best to continue the good work that we have done in delivering this important program to all the beneficiaries that depend on this program as financial support for their participation in traditional activities.

APRIL 2021 BOARD MEETING
On April 8 2021, the Board members held a virtual Board meeting with Director-general, Serge Larivière and the new Director of Administrative Services, Mr. Michael Wilson. The COVID-19 pandemic has forced the Board to hold their meeting virtually but business continues as usual and members continue to oversee the operations of the Board. We must adapt to the new conditions!

STAY ACTIVE EVERY DAY

You can do many physical activities as an individual, as a family, and as a community.
Canoeing and paddling trips are a great way to make fond memories together.
Active parents will have active children!

TIPS FOR BOATING SAFETY

Learn to swim. Eliminate your fear of water.

Wear a life jacket (PFD). Make it a good habit.

Avoid alcohol. Boating and alcohol is a bad mix.

Take a Boating Safety Course.

Check the weather forecasts.

Tell someone where you are going and what time you expect to be back.

Do a safety check on your boat and outboard motor.

Take extra gasoline.

Take extra clothes and a warm jacket.

Make a safety kit for your trip and yourself.

CATCHING MINK ON BIG RIVERS

BY SERGE LARIVIÈRE

MINK ARE ABUNDANT ALONG MANY OF THE WATERWAYS OF EYYOU ISTCHEE, THEY OFTEN RUN THE SHORELINE LOOKING FOR SOMETHING TO EAT.

For the trapper, trapping mink along these rivers can be challenging but one of the easiest ways of catching mink is to simply push some kind of bait, perhaps leftovers from muskrat, a small chunk of beaver meat or leftovers from ducks or grouse into a cavity and set a trap in front.

On rivers with soft banks, such as sand or clay, one can dig a small hole, push the bait in the back and simply set a small foothold trap. Ideally, the trap is set so the captured animal can reach deep water and drown. Near that set, one can set a small body-gripper to catch a mink that approaches the set. Minks are curious and will readily investigate any cavity along their route especially if there is smell of food. Feathers are also a great visual attractor, so if you have feathers from ducks or geese, they also make a great addition to any mink set.

Mink are never abundant, but they probably occur on any waterway in Eeyou Istchee. If you have them on your line and you are willing to catch them, try a few of these sets, you should be pleasantly surprised!

The Fishing Chronicle

FLUOROCARBON LINES

Fishing on rod and reel is great fun, especially when the fish are biting!

Sometimes, in clear water and on bright sunny days, fish are spooky and don't take lures as readily.

People who fish extensively have noticed that using certain types of lines can help increase your success when fishing with rod and reel. One such fishing line is fluorocarbon. Fluorocarbon lines are popular because they become invisible underwater, so fish cannot see them. Most people use a length of fluorocarbon tied to the end of their regular fishing line when the fish are very spooky, so it is always a good practice to carry a spool of fluorocarbon in your tackle box and add maybe 6 to 10 feet (2 to 3 meters) of fluorocarbon before you tie your hook or spoon or jig. This slight change to our fishing setup may very well increase your success in hooking fish and help you outfish the people in your boat!

Many brands of fluorocarbon are available and even though they are usually more expensive than regular fishing lines, they are well worth the price!

ECONOMIC SECURITY PROGRAM AND INTERVIEWS

Interviews with Local Administrators are essential during the year in order to update files and ensure that beneficiaries are receiving the correct amount of benefits that they are entitled to.

**FOR THE BENEFICIARIES OF
THE ECONOMIC SECURITY PROGRAM FOR CREE HUNTERS**

**ISP PAYMENTS
ARE DEPOSITED**

INTO BENEFICIARIES' BANK ACCOUNTS

EVERY MONTH.

IMPORTANT TO MEET FOR AN

INTERVIEW

WITH THE LOCAL ADMINISTRATOR

4 TIMES A YEAR

TO UPDATE BENEFICIARY'S FILE.

IMPORTANT

Files can be put on hold and no payment issued if no follow-up is done with Local Administrators.

Safety

In the bush

ICE THICKNESS

Traveling on ice is very normal for most Cree hunters during fall, winter and even spring. However, not all ice is created equal and all hunters traveling on ice must be cautious and aware of its conditions.

Depending on the way you travel, different thicknesses of ice are needed for safe travels. Many charts exist to confirm ice safety and hunters uncertain about ice conditions should either talk to experienced hunters, elders or consult ice safety charts for their area. In case of doubt, play it safe and avoid dangerous areas! Of course, everyone knows that cold weather makes ice thicker but sometimes moving water, such as rapids, can delay ice formation or make it less solid. By the same token, thinner ice usually exists near beaver lodges, so trappers walking around active beaver colonies should be aware of dangerous ice conditions.

Falling through the ice can be deadly and has claimed the lives of many Cree hunters. Please play it safe and stay away from dangerous conditions. Never trust ice blindly and in case of doubts, avoid risky areas or delay your travels. Falling through the ice is probably one of the greatest threats to hunters and trappers conducting harvesting activities in all areas of Eeyou Istchee. Please be safe out there!

Priscilla Bosum and Waylon Martinhunter are having fun hunting ptarmigan!

ÉDITORIAL

LES MEUNIERS SONT DES POISSONS QUI PASSENT SOUVENT INAPERÇUS EN TERRITOIRE CRI.

En effet, ces poissons, bien qu'ils soient omniprésents dans beaucoup de lacs et de rivières du territoire de la Baie-James sont rarement capturés par les pêcheurs à la ligne. Comme ce sont des poissons qui se nourrissent principalement au fond des lacs, les meuniers se capturent à la ligne seulement lorsqu'on utilise un appât stationnaire, comme un vers. Pour la plupart des chasseurs cris, les meuniers se capturent à l'aide de filets, souvent de façon involontaire dans des filets destinés aux espèces plus prisées comme le doré ou la truite grise. Pourtant, les meuniers sont comestibles et jouent un rôle important dans l'écologie des lacs en servant de proies aux poissons prédateurs tels que les brochets, les dorés et les truites grises. Dans la revue The Cree Hunter and Trapper, nous avons, par le passé, couvert plusieurs espèces de poissons très importantes pour les cris de la Baie-James, notamment la truite mouchetée, la truite grise, le brochet, le doré, les corégones, l'esturgeon et la lotte. Il va s'en dire que les meuniers sont un lien important de l'écologie des lacs de la Baie-James et comme ils sont uniques et très particuliers avec leur bouche en siphon, ils sont d'intéressants poissons à découvrir!

Parlant de notre magazine, l'édition que vous avez en main est maintenant le 30^e numéro publié par l'Office de la sécurité du revenu des chasseurs et piégeurs cris. Le premier numéro de ce magazine avait été publié en janvier 2007 et avait sur sa couverture un caribou. Beaucoup d'années ont passé depuis le premier magazine et nous sommes fiers de vous livrer ce 30^e numéro, qui continue de mettre en valeur les activités traditionnelles cris et les animaux que l'on retrouve sur le territoire de la Baie-James. Que ce soit pour les passionnés de photographie et de paysages du Nord ou pour les gens intéressés à suivre l'actualité de ce programme unique de la sécurité du revenu des chasseurs et piégeurs cris, ce magazine constitue un outil essentiel dans la dissémination de l'information! J'espère que vous en apprécierez le contenu et qu'il vous aidera à découvrir toute la beauté et la splendeur du territoire cri d'Eeyou Istchee.

Serge Larivière, Ph.D., MBA, ASC
 Directeur général,
 Office de la sécurité économique des chasseurs cris

PROGRAMME DE SECURITÉ ÉCONOMIQUE Et AUTRE REVENU

Une allocation quotidienne
est payable pour chaque journée
passée en forêt à pratiquer
des activités de récolte
SAUF lorsqu'une personne reçoit un
autre revenu.

**POUR LES PRESTATAIRES DU

Si vous recevez la PCU
(Prestation canadienne d'urgence)
ou une autre prestation d'aide financière
en lien avec la pandémie (« remplacement de revenu »),
les jours passés en forêt
pendant que vous recevez ce montant
ne sont pas payables.

Cependant, ils peuvent être comptabilisés
pour obtenir le nombre minimum de jours en forêt
pour s'inscrire au programme l'année suivante.

M

PROFIL D'UN ANIMAL

Meunier

« Tous les meuniers sont une importante source de nourriture pour les plus gros poissons prédateurs comme le grand brochet ou le touladi. »

Nom français: Meunier
Nom anglais: Sucker
Nom scientifique (Latin): *Catostomus*
Nom en cri: Namepiy
Syllabique cri: ᐱᐤᐱ

MEUNIER EST UN NOM GÉNÉRIQUE POUR PLUSIEURS ESPÈCES DE POISSONS QUI SE NOURRISSENT AU FOND DES LACS ET RIVIÈRES. À EYYOU ISTCHEE, IL EXISTE DEUX ESPÈCES COMMUNES: LE MEUNIER ROUGE (*CATOSTOMUS CATOSTOMUS*) ET LE MEUNIER NOIR (*CATOSTOMUS COMMERSONI*).

Ces deux poissons ont un corps essentiellement rond, avec une peau douce et mesurant généralement entre 30 et 45 cm (12 à 18 pouces). Les meuniers sont plus facilement reconnaissables à la position de leur bouche, qui est au bout de leur tête, mais qui s'ouvre comme un tube pointant vers le bas. Leur bouche n'a pas de dents et de très grosses lèvres, ce qui les aide à ramasser la nourriture au fond des lacs et des rivières. Le meunier rouge a une tête longue et pointue, beaucoup plus longue que celle du meunier noir.

Pendant le frai, les mâles des meuniers rouges développeront une large bande orange sur les côtés, d'où vient leur nom. En revanche, le meunier noir a une coloration beaucoup plus pâle et une tête plus courte et plus ronde. Les deux espèces peuvent être présents dans les mêmes lacs, mais les meuniers rouges fraient généralement avant les meuniers noirs et occupent également des lacs plus froids et plus profonds que les meuniers noirs. Le frai a lieu en avril ou en mai, dans des eaux peu profondes.

Les deux espèces de meuniers se nourrissent d'invertébrés, tels que les larves d'insectes, les petits mollusques et les vers. Tous les meuniers sont une importante source de nourriture pour les plus gros poissons prédateurs comme le grand brochet ou le touladi. Les deux meuniers sont rarement pêchés à la canne et au moulinet, mais sont plutôt capturés dans des filets. Au printemps, lors de la ponte, il est facile d'observer les meuniers nager dans les eaux peu profondes, à la base des rapides ou à l'embouchure de petits ruisseaux peu profonds avec des fonds de gravier. Les Cris utilisent souvent les meuniers comme appâts pour le piégeage, mais ils peuvent également être consommés, surtout au printemps. Ils sont abondants dans tous les lacs et rivières d'Eeyou Istchee mais rarement détectés, à moins de placer un filet là où ils se trouvent.

*Essayez
cette installation!*

PIÉGER LE VISON SUR LES GRANDES RIVIÈRES

PAR SERGE LARIVIÈRE

LES VISIONS SONT ABONDANTS
LE LONG DE NOMBREUX COURS
D'EAU D'EYU ISTCHEE, ILS COU-
RENT SOUVENT LE RIVAGE À LA
RECHERCHE DE NOURRITURE.

Pour le piègeur, piéger le vison le long de ces rivières peut être difficile, mais l'un des moyens les plus simples de capturer le vison est de simplement insérer un appât, peut-être des restes de rat musqué, un petit morceau de viande de castor ou des restes de canards ou de tétas dans une cavité et placer un piège devant.

Sur les berges faites de sable ou l'argile, on peut creuser un petit trou, pousser l'appât dans le fond et simplement poser un petit piège à rétention. Idéalement, le piège est installé pour que l'animal capturé puisse atteindre les eaux profondes et se noyer. On peut aussi placer un piège en X pour attraper un vison qui s'approche de cette installation. Les visons sont curieux et examineront toute cavité le long de leur parcours, surtout s'il y a une odeur de nourriture. Les plumes sont également un excellent leurre visuel, donc si vous avez des plumes de canards ou d'oies, elles constituent également un excellent ajout à toute installation pour visons.

Les visons ne sont pas abondants, mais ils se trouvent probablement sur tous les cours d'eau d'Eeyou Istchee. Si vous en avez sur votre ligne de trappe, essayez quelques-unes de ces installations, vous serez agréablement surpris!

PROGRAMME DE SECURITÉ ÉCONOMIQUE Et ENTREVUES

Chaque prestataire doit rencontrer son Administrateur local au cours de l'année afin de mettre à jour leur dossier et assurer qu'il ou elle reçoive le montant approprié de prestations auquel il ou elle à droit.

POUR LES PRESTATAIRES DU
PROGRAMME DE SÉCURITÉ ÉCONOMIQUE POUR LES CHASSEURS CRIS

LES PAIEMENTS SONT DÉPOSÉS

AU COMPTE BANCAIRE

TOUS LES MOIS.

IMPORTANT DE RENCONTRER
L'ADMINISTRATEUR LOCAL POUR

4 ENTREVUES PAR ANNÉE

POUR METTRE À JOUR LE DOSSIER.

IMPORTANT

Un dossier peut être mis en attente
et des paiements suspendus
si un suivi n'est pas effectué avec l'administrateur local.
